Data & Numbers

Important prompts and questions from this section — copy them exactly as shown in the lectures. Replace anything in [brackets] with your own details.

ChatGPT: Lookups That Join Two Sheets — VLOOKUP & XLOOKUP

> My spreadsheet has two tabs. Orders has columns A Date, B Customer, C Dish, D Plates, E Service. Rates has columns A Dish, B Price per plate. Write a formula for cell F2 in Orders that brings the price for that row's dish from the Rates tab. Give the formula first, then explain it in two short lines.

> Give the same lookup using XLOOKUP, and tell me in one line when XLOOKUP is the better choice.

ChatGPT: Maths With Conditions — IF, SUMIFS & COUNTIFS

> Same sheet. Write a formula for cell G2 that calculates the amount: plates times price, and if Service is Delivery, add 10 rupees per plate for packing. Explain the IF part in one line.

> Write a formula that totals the Plates column only where the Dish is Veg Thali.

> Write a formula that counts how many orders have an amount above 25000.

ChatGPT: Fix the Broken Formula

> Here is my formula, and what I expected. Formula: =VLOOKUP(Orders!C2,Rates!A:B,3,FALSE). It shows an error instead of the price. Expected: the price for the dish. What is wrong, and what should the formula be?

> This formula shows N/A even though Veg Thali exists in the Rates tab: =VLOOKUP("Veg Thali ",Rates!A:B,2,FALSE). What is wrong?
